CAT 403/CAT404/CAT405 - Feedback Form

**** SRD / Progress / Final ****

(Please circle whichever applicable)

Student's Name:	MUHAMMAD NURILLANWAR BIN MOHAMMADIN
Matric No.:	160349
Research Title:	IoT-InfraLab (Makmal-IoTInfra)

Corrections Needed/Comments:

The SRD's main weakness is that it stops one level short of "infrastructure defensibility": while the modules and use cases show what the system intends to do, the report does not sufficiently justify how the infrastructure behaves under realistic constraints, i.e. trust boundaries, threat model depth, performance (simulation + device management + IDS + attack simulation + dashboard), which raises feasibility risk unless the minimum viable deliverable is clearly prioritized and evaluation metrics are defined early.

SDG alignment is present and relevant but should be strengthened by mapping SDG 4 to concrete outcomes and indicators.

Corrections Needed / Required Revisions (SRD):

1. Define measurable success metrics (e.g., detection accuracy/latency, dashboard refresh latency, max simulated nodes, resource usage thresholds).
2. Add an explicit threat model + trust boundaries (what is trusted, what is hostile, where inspection happens, what attacks are in-scope/out-of-scope).
3. Clarify feasibility via MVP prioritization (what MUST work by end of Semester 1 vs "nice-to-have").
4. Strengthen evaluation plan (test cases + expected results + pass/fail criteria tied directly to objectives).
5. Improve SDG mapping (link SDG 4 to system features + measurable education impact indicators, not only narrative).

The presentation is clear but remains largely descriptive, with limited technical justification of Computing Infrastructure design decisions. Key aspects such as traffic flow, trust boundaries, and evaluation readiness are not sufficiently explained
